## DETAILED ACTION

### ***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 11/26/2007 has been entered.

### ***Claim Rejections - 35 USC § 102***

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 1-2, 36, 37 are rejected under 35 U.S.C. 102(e) as being anticipated by Papadias et al (US 2003/0174782 A1).

Regarding claim 1, Papadias et al disclose a transmitter for transmitting modulation symbols in a wireless communication system, comprising: a plurality of transmit antennas (105-1 to 105-4) for achieving transmit diversity (see[0020]); and a space time encoder (140) for encoding a plurality of input symbols into a plurality of symbol combinations to transmit the input symbols once from each transmit antenna at

each time period by using a transmission coding matrix with rows corresponding to transmission time periods and columns corresponding to the transmit antennas (see [0029], [0030], [0032]), and outputting the symbol combinations to the transmit antennas during the transmission time periods, the symbol combinations having orthogonal symbols, inversions and conjugates of the input symbols (see [0030], [0051]); and phase rotator part for rotating the phases of some of the symbol combinations outputted from the space time encoder by using the transmission coding matrix (see Figures 4-7, paragraphs 36, 42).

Regarding claim 2, Papadias et al disclose the transmitter of claim 1, wherein if the number of the transmit antennas is 4, the space time encoder generates the transmission coding matrix with four rows and four columns from four input symbols, and the inversions and the conjugates of the four symbols (see Figures 4-7, paragraphs 36, 42); and the rotator part selectively rotating rotates the phases of symbols in the at least two columns of a transmission coding matrix by a predetermined phase value (see Figures 4-7, paragraphs 36, 42).

Regarding claim 36, Papadias et al disclose wherein the transmission coding matrix has at least two columns orthogonal to each other (see [0051], [0057]).

Claim 37 is similar to claim 1. Therefore, claim 37 is rejected under a similar rationale.

***Allowable Subject Matter***

4. Claims 3-23 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

***Conclusion***
